

## Stimulating Neurons

- electrical stimulation with an electrode to bring neuron above AP threshold
- depolarize neuron by changing extracellular  $K^+$  concentration
- apply neurotransmitters/drugs that cause ligand-gated channels to open (eg glutamate)
- transcranial magnetic stimulation to induce current in neurons (noninvasive because magnetic field penetrates skull, body)
- optogenetics: insert transgenes for channels that are light-gated

---

---

---

## Stimulate electrically or with drug/neurotransmitter

apply drug (e.g. Glutamate) that opens  $Na^+$  channels

---

---

---

---

---

---

---

---

---

---

## Transcranial Magnetic Stimulation magnetic field $\rightarrow$ electric current $\rightarrow$ depolarization

---

---

---

---

---

---

---

---

---

---

Transcranial magnetic stimulation (TMS) over motor cortex and TMS paradigms assessing various inhibitory and excitatory neuronal populations. (A) TMS generates a fast, time-varying magnetic field, which penetrates the skull, inducing an electric field in underlying tissue, and depolarizes cortical neurons. At high enough intensities, stimulation of motor cortical regions results in motor-evoked potentials (MEPs) in peripheral muscles controlled by these areas, which can be measured using electromyography

## Transcranial Magnetic Stimulation

### Magnetic pulse to ease depression

A non-invasive procedure to help fight depression called transcranial magnetic stimulation, or TMS, uses a magnetic pulse to stimulate brain cells that control mood.

### Neuronetics NeuroStar system

40 min Rx x 5/week x 6 weeks

## Optogenetics

### Channelrhodopsins

Rhodopsins from microalgae and eubacteria that mediate phototaxis for photosynthesis

light -> increased Na<sup>+</sup> influx  
light -> increased Cl<sup>-</sup> influx

### Photoactivated Cyclases

light -> increased cAMP

### LITE

light -> increased transcription

# Channelrhodopsins

Major classes of single-component optogenetic tools include cation-permeable channels for membrane depolarization (such as channelrhodopsins (ChRs)), chloride pumps (for example, halorhodopsin (NpHR)) and proton pumps (such as bacteriorhodopsin or proteorhodopsin (BR/PR)) for membrane hyperpolarization.

## Optogenetics Starter Kits

- ▶ Complete Fiber Optics Kit for Optogenetics
- ▶ 470 nm LED Light Source
- ▶ 0.125 mm or 0.25 mm Ferrule Fiber Optic Cannulae and Cables
- ▶ Patch Cable with Optional Rotary Joint
